How to synchronize simultaneous playback on multiple screens

This guide explains how to activate synchronized playback on multiple screens. This function allows you to play the same content (same playlist) simultaneously on multiple screens, or to synchronize different media as they play.

For content to synchronize, you must use (or define) content with the same duration. Screens must also be running version 3 of the Zebrix player. Please note that it is also recommended to use the same screen models to avoid a lag due to processor/hardware performance (e.g.: an i5 is faster than a Celeron, the content will play a few milliseconds later).

Create one or more playlists

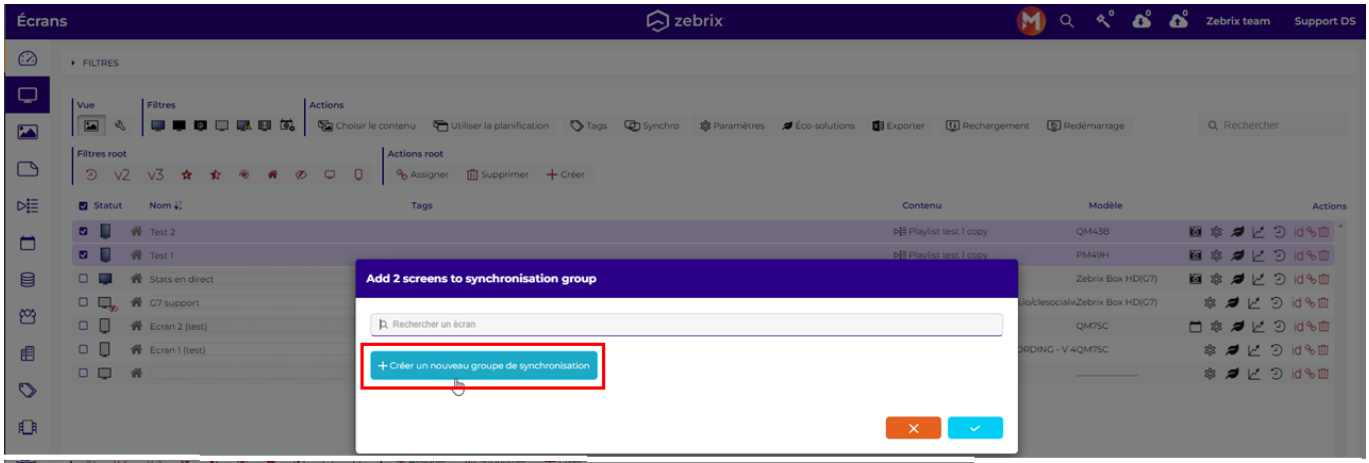

If you want to play exactly the same content on several screens, simply schedule the same playlist on the screens you wish to synchronize. To synchronize different content, you need to create a different playlist (per screen). Playlists must have exactly the same duration:

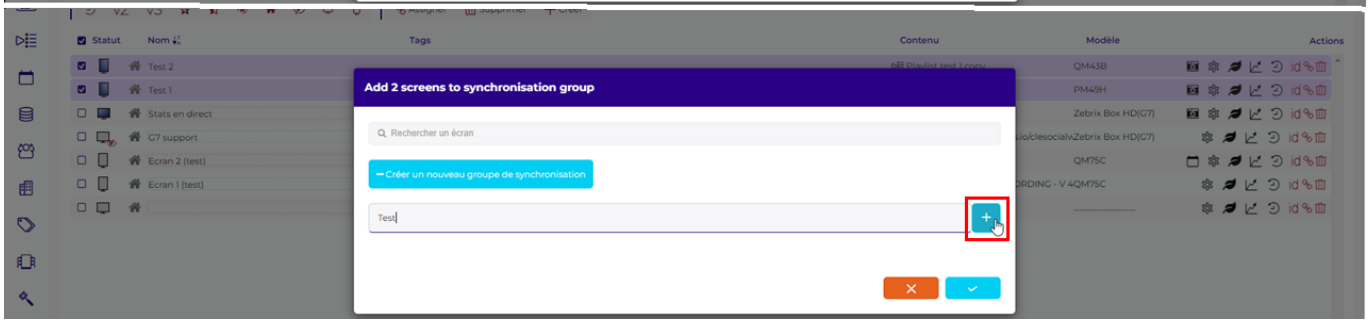

Scheduled on screen 1 Playlist 1		Scheduled on screen 2 Playlist 2	
Promo video 1	same content	Promo video 1	10 sec
Page welcome in English	different content	Page Bienvenue en Français	8 sec
presentation video LEFT	different content	presentation video RIGHT	5 sec
Poster 1	same content	Poster 1	20 sec
PROMO JANUARY	same content	PROMO JANUARY	15 sec
Promo video 3	different content	Promo video 2	10 sec

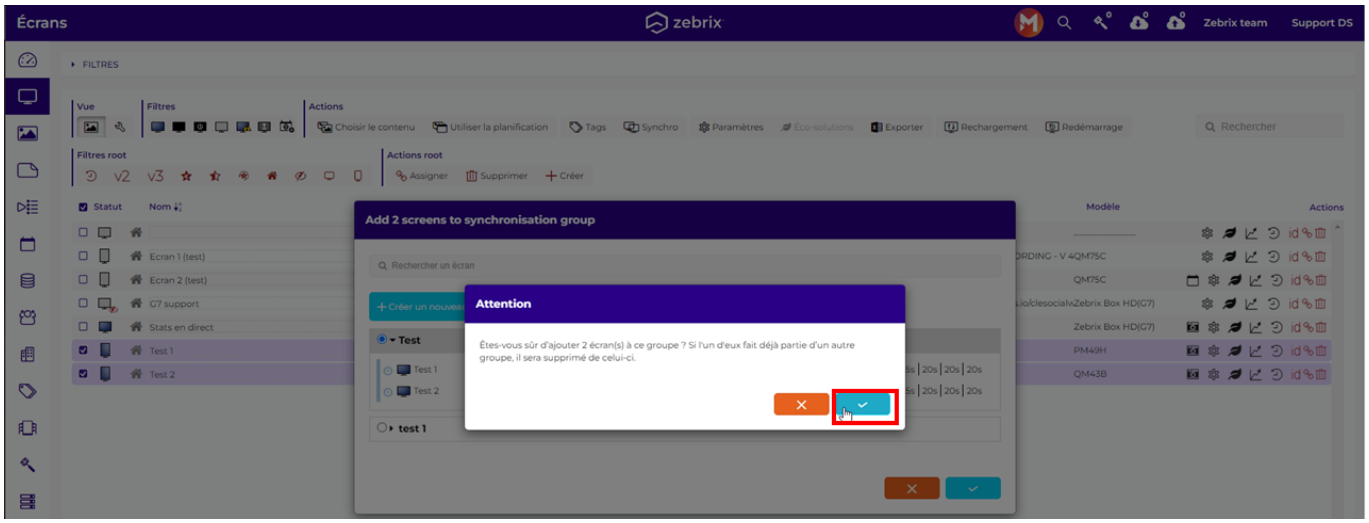

Create synchronization group

- Select the screens you wish to synchronize.
- Create the synchronization group.

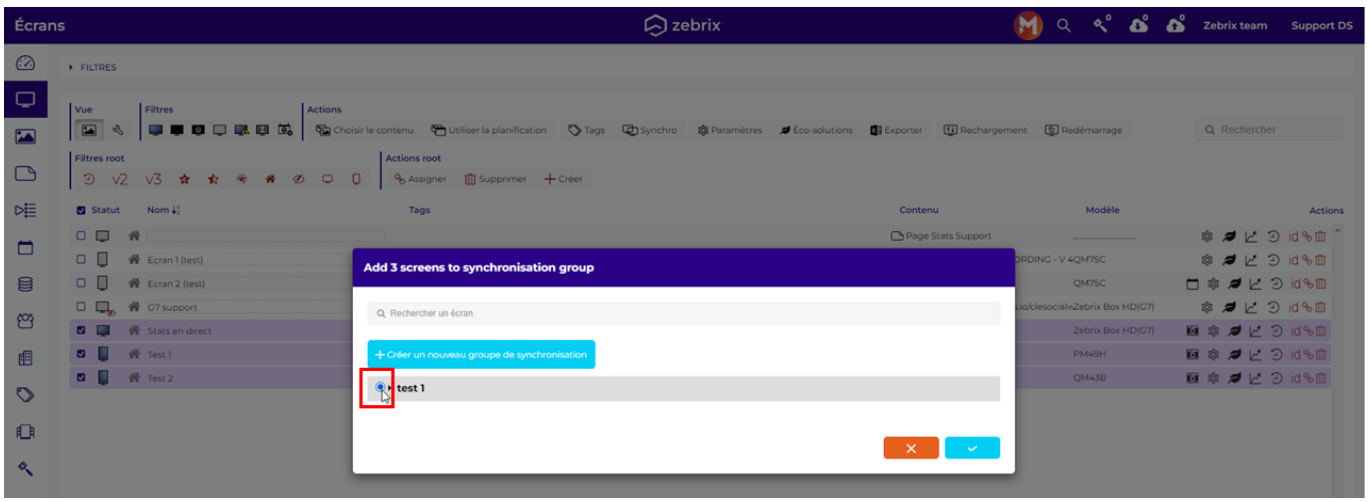

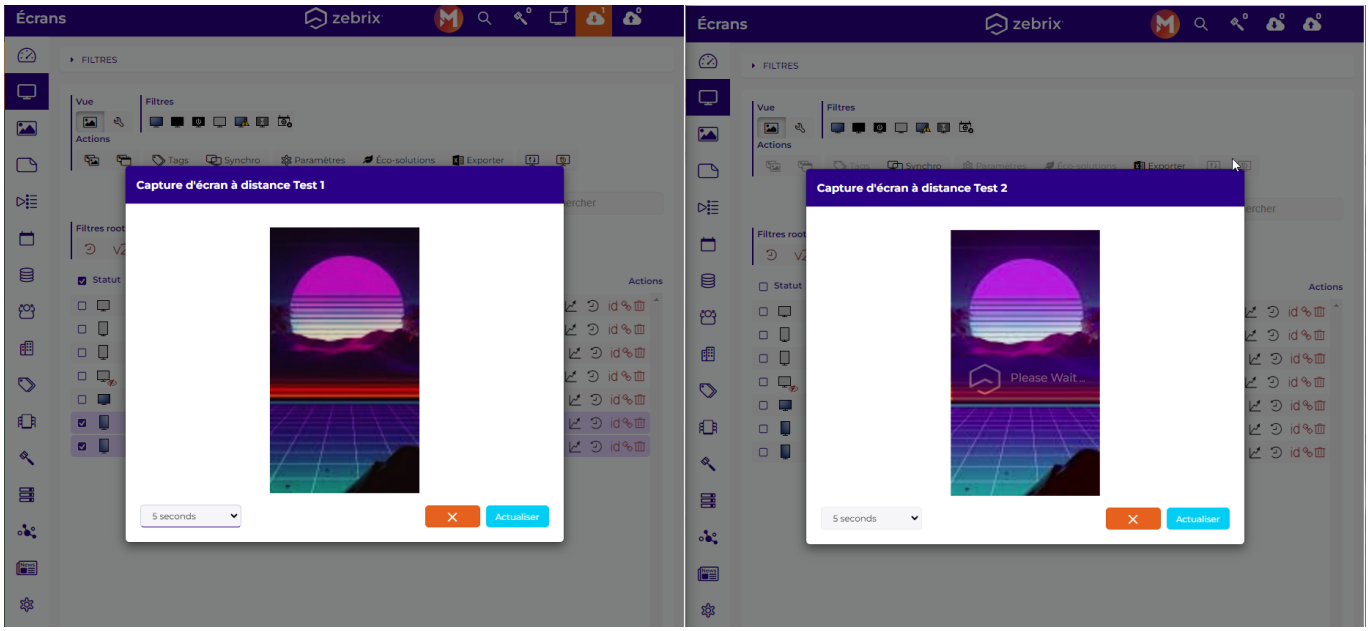

If the group is pre-existing, select the group to which to add the selected screens

Result

(For this example, the screens showed the same content)
