

# NUC Firmware Updates via USB Drive

Before starting, we recommend that you note down all the network information of your player, as this will be completely erased.

## Step 1: Update the NUC

Plug your USB drive into the player and turn it on.

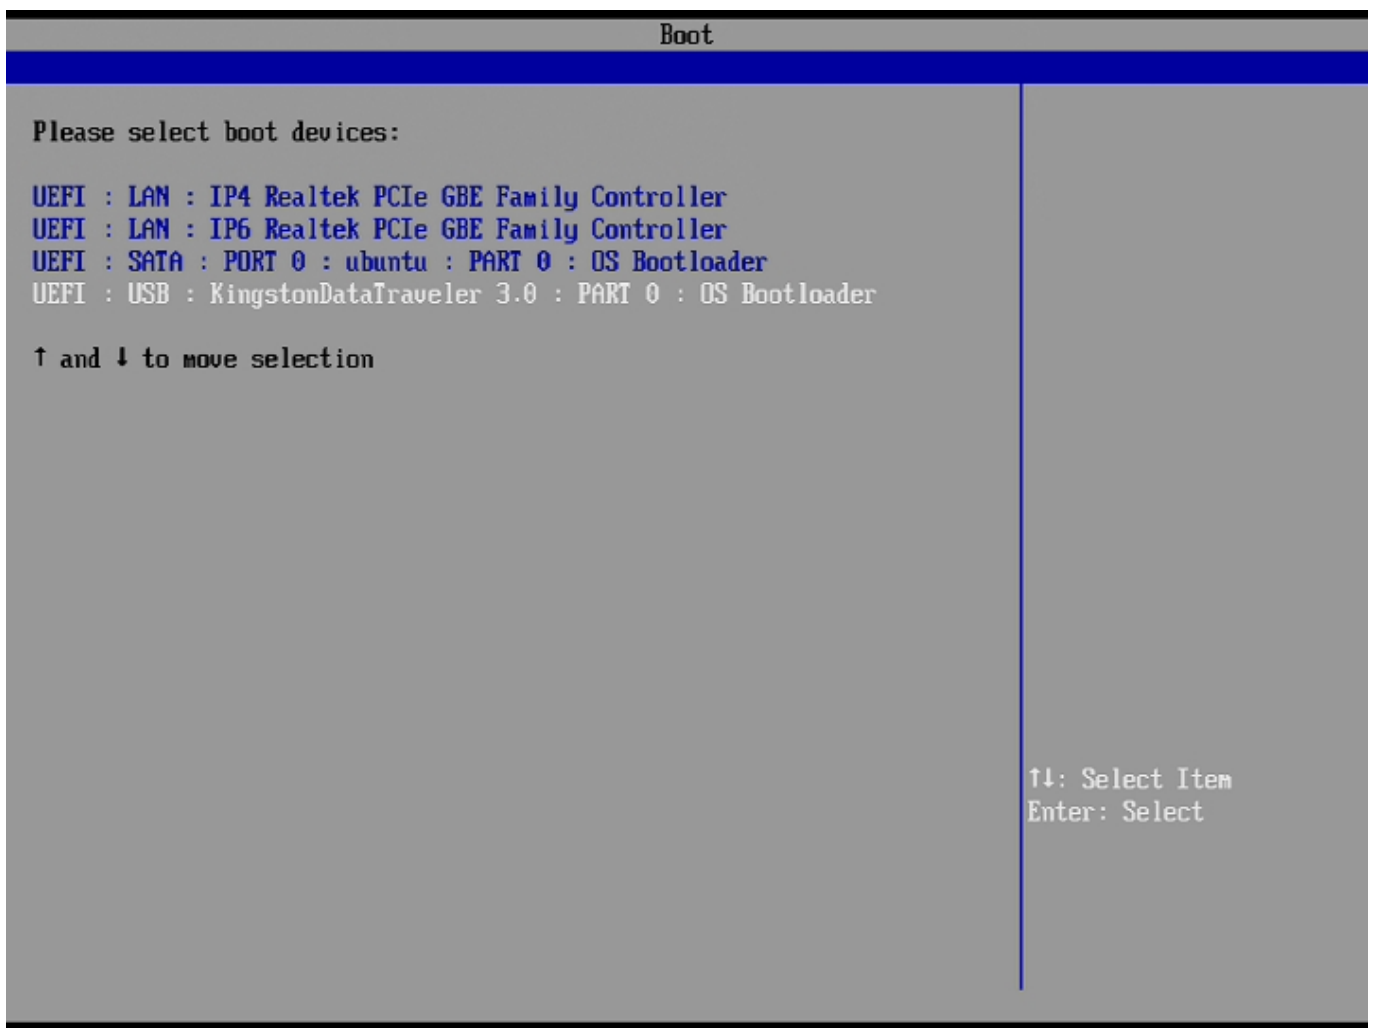

Normally, the player should boot automatically from the USB drive, but if it doesn't:

Case #1: You will need to access the BIOS of your player

You can access it by pressing F10 during the player startup. Once in the BIOS, you can select a boot order so that your player boots from the USB drive:

UEFI : USB : KingstonDataTraveler 3.0 : PART 0 : OS Boot loader

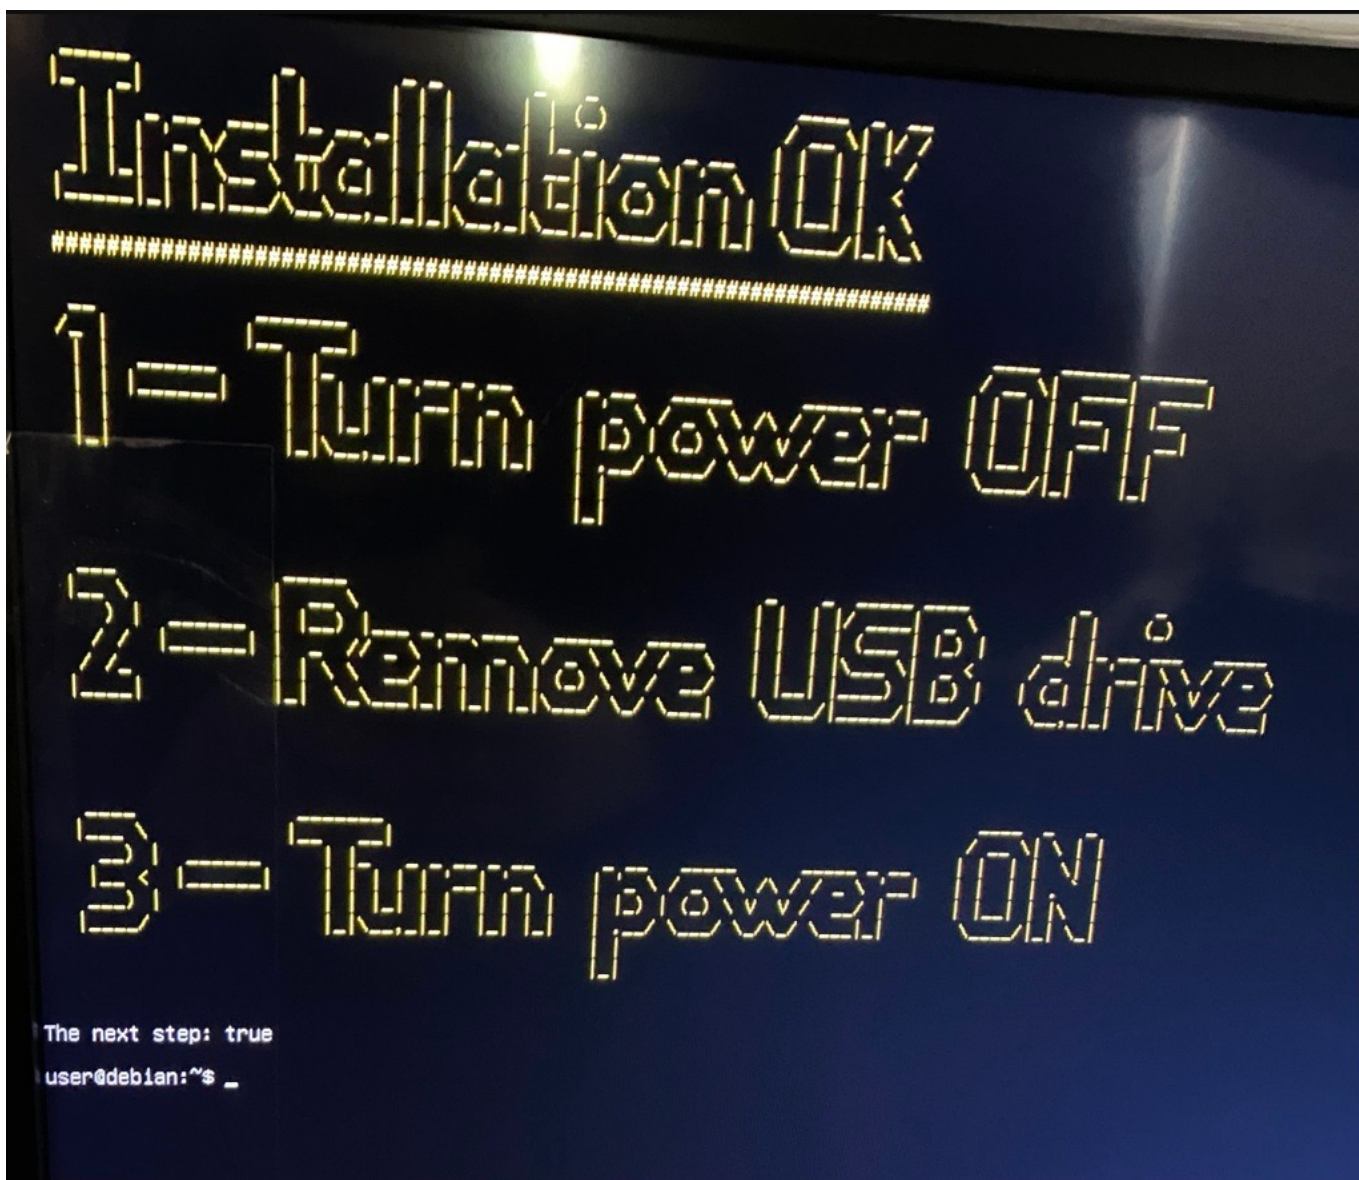

Case #2: A hardware issue prevents the player from booting correctly

In this case, please contact our support team at +33 (0)3 20 41 59 69 or by email at support@zebrix.net .

## Step 2: Choose the Firmware

Once the selection is confirmed, the firmware installation will start and all steps will execute automatically.
